- Drug Delivery
- Late Stage Biotech
- Specialty Pharma

Finding Green

Included in all of our Emerald product portfolios are companies that have initiated changes in their manufacturing process to be more energy efficient including reducing waste in both operating and stand-by modes. Companies with developed technologies that:

- recycle 1,000,000 tons of fiber on an annual basis
- reduce mercury flue emissions
- purifies water exceeding current established standards

.....and are providing developments in:

- ◆ semiconductor processing
- ◆ providing environmentally friendly packaging
- ◆ the use of pesticides, agricultural run-off, composting, erosion, etc.
- ◆ recycling steel byproducts in aluminum production

The initiatives that we have uncovered reach across the globe including rain forest preservation. We believe these companies with their stated and proven commitment to incorporate protective measures in their process are potential beneficiaries of the green initiatives to be put forth by the present Administration.

Although not a primary factor in determining investment worthiness, we salute the many companies we hold in our portfolios who have made the commitment to practice environmentally sound initiatives.
